

As **Darguner Brauerei**, we make our **contribution to climate protection** by increasing our **energy efficiency** and – associated with this – reducing our **CO<sub>2</sub> emissions**.

We are constantly working to reduce energy consumption to a minimum in all areas and to use renewable energies whenever it is possible.

In concrete terms this means:

1. We make sure that **new systems, processes or buildings** consume as little energy as possible.
2. Whenever it is possible we use those **devices and machines** that have the lowest energy consumption compared to others.
3. We provide each employee with the necessary **means and information** to carry out their activity as efficiently as possible.
4. We appeal to our employees for making **suggestions** on how we can save energy or improve energy management and we take these suggestions seriously.
5. We comply with all **energy law framework conditions**.

Our energy management system is certified according to DIN EN ISO 50001 and is audited annually by our top management and by an external certification company.
